

# Hyperion System 9 BI+ Interactive Reporting

*Hyperion® System™ 9 BI+™ Interactive Reporting™ (Interactive Reporting)* provides executives, business users, and analysts with the most intuitive user-directed query and analysis capabilities available today. It delivers powerful capabilities through an easy-to-use interface that lets users design their own dashboards, then quickly monitor and evaluate information. *Interactive Reporting* is easy to deploy, provides access to data locked in transactional systems, and leverages information from your existing data stores.

## Highlights

- Spot trends early with graphical, interactive dashboards so you can quickly leverage opportunities or take corrective action
- Empower business users to create a dashboard with easy, wizard-based dashboard development
- Encourage rapid user adoption with intuitive ease-of-use, and minimal training and support
- Protect IT investments in existing systems with direct support for heterogeneous data sources

## User-directed ad hoc query, analysis, and dashboards

### Key Benefits And Features

#### Gain a relevant, cohesive view of operations and the business as a whole with personalized dashboards

*Interactive Reporting* synthesizes multiple analyst reports, presentations, and spreadsheets to deliver visibility into organizational performance. Its personalized dashboards offer at-a-glance summaries of key performance indicators (KPIs) so managers can quickly spot trends and anomalies, select different views of data, and drill into deeper detail for the most relevant insight into the health of the business.

#### Deploy rapidly with self-service dashboard creation

*Interactive Reporting* helps business users create new dashboards quickly. Anyone who can create a report can assemble a dashboard, using the wizard-driven development environment that requires no coding. Users can combine queries from multiple data sources on the same dashboard, providing drill paths into additional reports and other dashboards for deeper analysis. Development costs for business intelligence (BI) capabilities drop—and user acceptance improves—because managers who best understand their business needs can work with business analysts to quickly create dashboards without relying on IT.

#### Provide offline access from a variety of devices to business intelligence

*Interactive Reporting* enables mobile employees, customers, and partners to view business information, even when they're offline. Managers can, for example, prepare presentations with rich analytic content while traveling to a meeting.

### **Deliver multiple levels of viewing and analysis in a single report**

Rather than being forced to design multiple reports for people with different access privileges, *Interactive Reporting* lets you deliver a single report that different users can interact with based on their varying privileges. Reports support both pre-defined and “drill anywhere” analysis, allowing users to instantly expand their ad hoc analyses by adding items to their datasets.

### **Gain broad user adoption with an easy-to-use thin-client interface**

With drag-and-drop functionality, the intuitive thin-client interface of *Interactive Reporting* lets nontechnical users quickly create their analyses. Managers access common data models created by power users, analysts, or IT—and then select information, specify sorts, define filters, even create computed items. They also can access report visualization options, such as charts, gauges, and pivots for “cross-tab” reporting. Conditional formatting further enables a management-by-exception paradigm.

### **Access a wide variety of business data sources**

*Interactive Reporting* lets you access and analyze data from transactional systems, data warehouses, and data marts. With connectivity to leading relational databases, it delivers more complete information to users, enabling better decisions. Managers and analysts can access both data and metadata from multiple sources on one report, gaining side-by-side analysis.

### **Assign permissions based on roles**

With *Interactive Reporting*, you can define granular permissions for viewing, modifying, scheduling, and publishing content, as well as managing users. Administration can be delegated so that user communities can become self-sufficient, reducing the strain on scarce IT resources.
